FLEXIBLE AUTOMATION FOR EVERY FLEXSCREEN NEED

ERDMAN® HIGH SPEED FLEXSCREEN LINE

1 Screen Every 15 Seconds | 4 Operators

X FLEXSCREEN BY  **RITESCREEN**

WHY CHOOSE FLEXSCREEN AUTOMATION?

- **Unmatched Savings:** Reduce production costs with in-house manufacturing.
- **Scalable Options:** Choose a line that fits your volume and budget.
- **Rapid ROI:** Your investment pays for itself quickly through cost savings and increased production capacity.
- **The Equipment Does The Work:** Your team will be up to speed and comfortable with the process in minutes - not weeks or months!
- **Industry-Leading Technology:** Built with precision and designed for reliability.

Ready to maximize your profitability? Let us help you choose the perfect manufacturing line for your needs. Contact us now to learn more about FlexScreen's automated solutions.

WINDOW WRAP®

Self-adhesive. Self-sealing. The system to stick with.

WindowWrap® delivers a complete line of proven flashing solutions.

In today's economy, builders demand maximum value from their building materials.

When it comes to flashing, it means keeping out more than just water. Count on the WindowWrap® family to deliver versatility, quality and value to each and every job. Protect your reputation by using a product line that won't let you down – WindowWrap®.

WindowWrap® Flashing Solutions

- Flex options for sill pan flashing and curved openings
- Variety of straight flash products
- Low-temperature-rated options
- Made in the USA

Complex Simplicity

We're part of an intricate industry where many parts work in tandem for the same end goal

BY LAURIE COWIN

One of the best parts of my job is visiting industry members. In mid-April, vice president, sales, Emily Thompson, senior sales consultant Chris Hodges and I visited several companies. We saw research and development, toured manufacturing floors, and saw first-hand how, as one source put it, “We manufacture a very simple product in a very complex way.” Only, once you look at it, you realize a window is anything but simple.

Vitro led us on a tour of its research and development facility in Cheswick, Pennsylvania, outside of Pittsburgh. The building is full of engineers, physicists, scientists and more. Incredible work is done there every day that influences the buildings in which we live, work, play and heal. Glass sits in various testing chambers to evaluate its performance against high heat, humidity, salt spray, dry conditions, freezing temperatures and more. Microscopically thin silver coatings are evaluated to ensure no blemishes exist.

Quanex's Cambridge, Ohio, facility manufactures its spacers. At first glance, they appear to be rather simple. But after touring the facility and getting some hands-on time with the product, I see it's multi-layered and each layer plays a vital role in a window's performance.

GED puts its machinery together in its Glenwillow, Ohio, location, with so many intricate parts that it makes putting even the most complex K'nex system together look like child's play. Veka North America, headquartered in Fombell, Pennsylvania, extrudes incredible amounts of raw material for windows and doors.

This issue further demonstrates the complexity of our industry. The annual Top Manufacturers report and list, which starts on p. 30, takes a 30,000-foot view of the construction and manufacturing industries before diving into fenestration specifics.

The list, however, looks a little bit different this year. Rather than organizing the list by gross sales ranges as we have historically done, the Top Manufacturers are listed by national and regional manufacturers. We know how much manufacturers value their privacy in this industry, and we hear you that it's a big ask to provide us with even a broad range of your gross sales. Our team has researched as best we can where companies don't volunteer that information. With a busy M&A market and more companies going private, this has become harder each year.

Window + Door has the dual responsibility of providing a comprehensive list of fenestration manufacturers and organizing it in a verifiable, factual manner. This new structure allows us to concretely place manufacturers within the list, ensuring we provide a list that meets Window + Door's editorial standards. Companies that opted to provide their revenue range still have that information in their listing.

It was my honor to hear from so many of you to learn more about what you're seeing on the front lines, celebrate your successes and problem-solve challenges. ■

POWERLINK ENABLING THE FUTURE OF SMART WINDOWS

*Switchable
Privacy Glass*

Quanex is proud to unveil PowerLink—another groundbreaking innovation from AmesburyTruth! PowerLink is a concealed hinged wiring conduit that enables seamless power transfer to a window's operable sash, unlocking new possibilities for hardwired smart home capabilities. By enabling technologies such as switchable privacy glass, electrochromic tinting, transparent solar energy harvesting, and motorized blinds between the glass, it expands the potential of operable windows beyond traditional fixed sash applications.

News

Chelsea Building Products Breaks Ground on New Facility

Chelsea Building Products broke ground on a 228,000-square-foot manufacturing facility in Westmoreland County, Pennsylvania. The project will increase production capacity for the company's PVC window and door profiles, as well as space for blending compound materials.

Once completed, the facility will feature insulated precast construction, 100-by-50-foot bays in the production areas, 32-foot clear height, 10 fully equipped dock positions, and a 10,000-amp electrical service. The facility's design also accommodates a potential future expansion of approximately 170,000 square feet. This project marks Chelsea Building Products' third manufacturing site, and its second facility in Pennsylvania.

Lexington Manufacturing Expands in Georgia

Lexington Manufacturing LLC announced plans to expand its physical footprint by opening a 65,000-square-foot location in Covington, Georgia. This new location will offer on-site profile wrapping capabilities at its opening in early 2026, as well as distribution services of Lexington's other capabilities currently being produced at its four Minnesota-based locations. In addition to supporting its current customers and distribution partners, Lexington aims to expand its relationship with partners in the Southeast region of the country.

Aeroshield Partners with ODL on Insulating Aerogels

AeroShield Materials, which produces

transparent aerogel insulating glass for full-size entry doors, is partnering with ODL Inc. to deliver them to homeowners.

As part of the partnership between the two companies, ODL will complete performance testing on hundreds of the aerogel-insulating doors and windows in various sizes and dimensions, including full-view, 22-by-64-inch door glass. This will support the National Fenestration Rating Council certification for aerogel-insulating products. The aerogel-insulating patio and entry door prototypes currently undergoing testing are expected to be commercially available by the end of 2026.

Energy Star Program to End

The Environmental Protection Agency plans to end Energy Star, a popular program that certifies the energy efficiency of residential windows, doors, skylights and home appliances.

In the residential glass industry, the Energy Star program has traditionally played a significant role in promoting energy-efficient windows and doors, both critical components of building envelopes, influencing energy consumption and occupant comfort. Energy Star-rated products typically feature advanced technologies, such as low-emissivity coatings and improved framing materials, to enhance thermal performance and reduce heat transfer.

Version 7.0 incorporated more stringent requirements and updated technologies to reflect advancements in energy efficiency. These requirements continue to focus on U-factor and solar heat gain coefficient, or SHGC, but update the climate zones to better reflect the International Energy Conservation

Code and the changing climate.

The new criteria for Energy Star 7.0 went into effect in October of 2023.

Kolbe Installs New Solar Panel System

Kolbe Windows & Doors recently completed and activated a solar panel system on the roof of its main manufacturing facility in Wausau, Wisconsin. This 999.6-kilowatt alternative energy system, consisting of 2,061 photovoltaic panels, is expected to offset 31.8% of the plant's current energy consumption.

Kolbe worked closely with Northwind Solar on the design and installation of the system. The double-sided design of the panels allows them to capture sunlight even after snowfall by gathering reflected light through the underside of the panel. The installation began in 2024 and was partially funded by a United States Department of Agriculture Rural Development grant as part of the Rural Energy for America Program.

YKK AP Introduces the BetterBillet

YKK AP America introduced the BetterBillet, a billet comprising recycled aluminum scrap and aluminum sourced from low carbon suppliers. The BetterBillet will move the company's sustainability efforts forward with two core benefits, according to the company: Low carbon sourcing and full control of manufacturing and production processes. BetterBillet also plays a pivotal role in YKK AP's "Evolution 2030" initiative, which focuses on reducing environmental impact through carbon reduction.

Redefining Durability and Customization with Coextrusion Technology

Coextrusion technology is streamlining production and enhancing performance to meet modern architectural demands

BY GARY LUTHER

In the world of windows and doors, innovation is the name of the game. Builders, architects and homeowners demand materials that go beyond the basics—delivering durability, low maintenance and standout design. This is where coextrusion technology comes into play, offering an advanced approach that is reshaping the industry. By enabling multi-layered materials that enhance performance and aesthetics, it transforms the design, manufacturing and durability of modern windows and doors.

This article delves into this technology, highlighting its benefits and its role

in helping manufacturers streamline production, reduce costs and adapt to emerging trends, all of which help ensure a competitive edge in a dynamic market.

Understanding coextrusion technology

At its core, coextrusion builds on the traditional extrusion process, where materials like polyvinyl chloride, or PVC, are shaped by pushing them through a die to form specific profiles. What sets coextrusion apart is its ability to combine multiple layers in a single pass, bonding them at a molecular

level. This process integrates structural strength, weather resistance and color into the profile without requiring additional steps like painting or laminating.

The result is a unified product that resists common wear issues such as peeling or fading. Coextrusion's efficiency and precision ensure that protective layers and finishes are built into the product during production. While painting and laminating offer benefits like customizable colors and unique textures, coextrusion can provide a complementary solution for projects that prioritize durability and shorter lead times in manufacturing.

From structural support to weather resistance and vibrant colors, coextrusion combines essential features in one streamlined process. Its ability to adapt to bold, modern design trends, like black and bronze finishes, has made it a transformative solution.

How coextrusion is adapting to market trends

In today's construction landscape, fin-

ishing methods such as paint, laminate and coextrusion each cater to specific needs. Coextrusion, however, is gaining momentum for its ability to address the demands of modern design. As darker, bold colors such as black and bronze rise in popularity, manufacturers must address heat absorption and potential material stress. Coextruded profiles feature protective capstock layers enriched with ultraviolet inhibitors and reflective pigments

This technology becomes even more significant for manufacturers that are vertically integrated, as it enables them to efficiently adapt to design shifts while managing production costs. By controlling key processes like coextrusion in-house, vertically integrated companies can shorten the supply chain and eliminate secondary finishing steps, such as painting or coating. This not only reduces costs but also shortens lead times since the color is built directly into the material during extrusion.

Balancing performance and production

Each finishing method offers unique strengths. Painting remains ideal for highly customized, one-off colors, while laminating is prized for its ability to add textures like woodgrain. Coextrusion, however, stands out for its seamless integration of color and durability during production. This process simplifies manufacturing, enabling quick color transitions and reducing overall production complexity.

This flexibility can make coextrusion a preferred choice for large projects requiring consistency and resilience. By providing a reliable, efficient option that can address a variety of design and performance needs, coextrusion is a valuable tool for manufacturers navigating the evolving demands of modern construction.

Future directions in coextrusion

As coextrusion technology evolves, its potential applications are expanding beyond windows and doors. Some manufac-

turers are working to develop even more weather-resistant materials and capstock formulations. New micro-ingredients, designed to combat fading and heat build-up, are making darker colors more viable in demanding environments.

Emerging possibilities include using coextrusion technology to incorporate components directly into the profile part. One such application is coextruding weatherstripping with the profile to create enhanced weather seals to address extreme weather conditions, such as hurricanes. These advancements demonstrate how coextrusion meets today's needs while preparing for tomorrow's challenges.

A comprehensive approach to design

No single method dominates the landscape of window and door manufacturing. Instead, the industry

thrives on the complementary strengths of coextrusion, painting and laminating. Whether the goal is efficiency, aesthetic customization or unique surface textures, each approach plays a vital role.

By leveraging these technologies together, manufacturers continue to push the boundaries of innovation, creating building materials that are durable, adaptable and visually stunning. Coextrusion stands out for its ability to address multiple demands in a single, efficient process, making it an indispensable tool in the evolving construction landscape. ■

Performance Improvements in Insulating Glass Units

Elevating efficiency and unlocking superior insulation with advanced IGUs

BY KAREN WEGERT

The following is an excerpt from NGA Glass Technical Papers FB49-17 (2022) Performance Improvements in Insulating Glass Units: Cavity Gap and Insulating Gases, and FB63-19 Products for Energy Applications, available for free download at glass.org/store.

The insulating glass unit has replaced single lites of glass in all but a few areas. The basic principle of an IGU is to improve thermal performance by incorporating a gap between two or more lites of glass. A properly sized gap will reduce convection within the IGU with no effect on daylighting, thus reducing thermal transfer by as much as half. The design professional can further improve thermal performance by choosing from a variety of IGU component options, such as coated glass products with low-emissivity properties, insulating gases, multi-cavity IGUs and varying cavity gap width.

Importance of gas content

The thermal performance improvements of the IGU are dependent on the ability of the IGU to retain the insulating gas. A reduction in the concentration of insulating gas within the IGU has a linear correlation

to the reduction in the thermal improvement of the unit. Gas retention within an IGU is dependent on several variables including, but not limited to:

- Permeability of the sealants used in the edge seal construction
- Permeability of the spacer
- Integrity of the bond between glass and sealants, and spacer and sealants

- Sealant bond width
- Uniformity of the sealants used in the unit construction
- Cleanliness of the glass and spacer during construction of the IGU that enables proper adhesion of sealants
- Fluctuation of internal airspace pressure due to wind loads, changes in temperature, altitude, glazing

Figure 1: Components of total fenestration U-factor (center-of-glass, edge of glass and frame).

system and general environmental conditions

Thermal performance

The fenestration industry measures the thermal performance of its products in terms of thermal transmission, or U-factor (also known as U-value), which is expressed in Btu/hr/ft²/°F. U-factor is a measure of the air-to-air heat transmission (loss or gain) due to the thermal transmittance resulting from the difference between indoor and outdoor temperatures. As the center-of-glass U-factor decreases, so does the amount of heat that is transferred through the IGU. The lower the U-factor, the better the product will insulate a building.

U-factor and R-value are reciprocals. For instance, dividing 1 by the U-factor will obtain the R-value for glass (for example, a 0.25 U-factor equals an R-value of 1/0.25, or 4). However, U-factors and R-values for other building materials, such as insulation, are not always directly comparable to glass.

While center-of-glass U-factors are useful for comparison in many glass products, the center-of-glass U-factors will typically be lower than the total fenestration system U-factor. Total fenestration system U-factor is calculated using thermal measurements from the center and edges of the glass, the frame and along any dividers the window/door may have (see Figure 1).

Coating type and surface location

Low-e coatings are designed to minimize the amount of ultraviolet and infrared light that can pass through glass without compromising the amount of visible light that is transmitted. There are two types of low-e coatings: passive low-e coatings and solar control low-e coatings. Passive low-e coatings are designed to maximize solar heat gain into a home to create the effect of “passive” heating and reducing reliance on artificial heating. Solar control low-e coatings are designed to limit the amount of solar heat that passes into

a home for the purpose of keeping the interior cooler and reducing energy consumption related to air conditioning.

Low-e coatings are applied to various surfaces of IGUs. Passive low-e coatings function best when on the third or fourth surface (furthest away from the sun) and are typically used in heating dominated climates, while solar control low-e coatings function best when on the lite closest to the sun, typically the second surface, and are normally used in cooling dominated climates. Solar control coatings can be combined with passive coatings on the fourth surface to improve performance values. In addition, tinted substrates can be combined with low-e coatings to decrease solar heat gain and add desired aesthetics.

Insulating gases

Traditionally, an IGU is filled with air. Some inert gases are less thermally conductive than air and will lower, or improve, the U-factor of the IGU, typically in the range of 10% to 15%. Argon is the most commonly used inert gas between the lites of an IGU to improve its thermal performance. Krypton and argon-krypton mixtures are also possible. Contact the IGU fabricator for available gas mixtures.

Optimize the cavity gap

A key to proper IGU design for insulating gases is to optimize the cavity gap for the gas being used. There is an optimal spacer width for every type of low conductivity gas, which minimizes the gas convective heat transfer. This optimum gap width differs for different gas types and different weather conditions. In general, warmer weather conditions result in wider optimum gap widths. The free LBNL WINDOW computer program can be used to readily determine optimum gap widths for unique conditions. In North America, the National Fenestration Rating Council standard summer or winter environmental conditions are used in the calculation. Consult the fabricator

for cavity gaps available, as spacers are only available in discrete dimensions.

Different gases have different optimal glazing space gaps based on their respective densities to reduce convection inside the IGU, while also having the greatest possible distance to reduce conduction. The typical nominal gap width dimensions are:

- For air, approximately ½ inch (13 millimeters)
- For argon, approximately ⅞ inch (11-12 mm)
- For krypton, approximately ⅝ inch (8 mm)

Anything greater will increase convection inside the IGU, decreasing thermal performance.

Summary

When thinking of window designs, size, substrate, tint color and other aesthetic qualities come to mind. However, low-e coatings play an equally important role and significantly affect the overall performance of a window and the total heating, lighting and cooling costs. The cavity gap size and addition of gas or coatings are designed based on the performance requirements of the building envelope. Inert gases (argon and krypton) offer lower U-factor than with air. The effect of using krypton gas in place of argon gas is more beneficial with narrower gaps than with wider gaps.

The use of multiple low-e coatings can also significantly reduce U-factor. The interrelated nature of properties like U-factor and building interior glass surface temperature means that at times performance in one aspect may need to be reduced to achieve better performance in another. In addition, choice of overall IG thickness may be a consideration based on the framing system, which can then affect gap distance, glass thickness and choice of inert gas. ■

Navigating Uncertainty

As tariffs and economic headwinds begin to unravel confidence, industry leaders brace for impact amid mixed signals on consumer demand and housing affordability

BY ANDREW PETRYK

Sentiment at the start of 2025 was positive with companies reporting healthy backlogs and expecting growth coming off solid performance in 2024. More recently however, the tone has shifted to one of caution amid broader uncertainty, partly driven by policies of the Trump administration that are creating near-term headwinds in the market. We took a deeper dive into the “state of the market” through conversations with industry participants to gauge current confidence levels and their outlook for 2025.

Tariffs and surcharges

Tariffs have become the hot button issue for executives across the building products market. Some companies are reexamining their supply chains and considering alternative sources; however, certain materials have limited substitutes. According to industry sources, an estimated 80% of U.S. softwood lumber imports come from Canada. Float glass currently doesn’t have a domestic source in Canada where window and door manufacturers are bracing for the next round of U.S. tariffs to be announced.

“We’re certainly expecting some sort of medium-term tariff impact,” remarked Neil Fast, CEO at Loewen Windows, a supplier of premium windows and doors serving the luxury architectural market in Canada. Loewen has plans in place for multiple different tariff scenarios, Fast indicated. “Softwood, lumber, steel, wallboard, gypsum, all those materials have a high degree of cross border trade between the U.S. and Canada, and that’s going to be tricky. I feel like the entire supply chain serving the residential housing market is holding their breath right now.”

“Even with domestic suppliers, there is some ‘opportunism,’” says Kevin Madden, co-founder and managing partner at Saothair Capital Partners. “Pricing tends to increase across the market.” Saothair owns Pioneer Windows, a manufacturer of architectural aluminum products for high-end residential, commercial and institutional buildings, which it acquired in November 2024. “No one is fully insulated,” Fast adds. “We do think there’s going to be some pricing pressure here in the market. I’m really expecting sort of an off-cycle, mid-year price increase in the window and door business here.”

Given the prevalence of tariffs, most companies don’t anticipate having issues passing on those costs because everyone is going to be impacted by them. Ultimately, the higher construction costs will have ramifications on consumer spending with executives speaking to tempering demand over the intermediate term. “We’re starting to see some easing in our markets,” says Michael Barr, CEO of U.S.-based WeatherBarr Windows

& Doors, a third-generation family business specializing in high-quality, custom vinyl windows and doors. “To me, that’s consumer confidence. It’s certainly not a fundamental issue of whether we need houses or not. At the end of the day, the housing market has demand, but affordability is a problem.”

Barr cited the potential impact of tariff surcharges, in addition to higher prices on building materials, which is driving up housing inputs. Added to that is a shortage of reasonably priced homes, leading some consumers to pause on home buying and forgo large renovation projects until there is more visibility. “It does undermine consumer confidence because everything is going to get more expensive,” Barr adds. In the U.S., consumer confidence declined in March to its lowest level since February 2021 underpinned by concerns that rising inflation and Trump tariffs would undercut economic growth.

Affordability and inventory

Relief for borrowers would be a welcome catalyst in the U.S., where mortgage rates continue to remain above 6%, and despite expectations for interest rate cuts in sight, experts predict only modest easing keeping rates elevated in the 6% to 7% range through 2025. Mortgage rates in Canada have declined, with the prime rate now at 4.95%.

March heralded the formation of a Joint Task Force to identify public land suitable for residential development, marking a first step in the Trump administration’s promise to lower the cost of U.S. housing and expand housing supply. The U.S. Department of Housing and Urban Development will work alongside the Department of the Interior in this effort. “Lack of inventory remains one of the biggest barriers to affordability, driving up home prices and putting the dream of homeownership out of reach for too many Americans,” says Shannon

McGahn, executive vice president and chief advocacy officer at the National Association of Realtors, in a statement. According to Brookings, the housing shortage stood at an estimated 4.9 million housing units in 2023.

Despite the near-term challenges, we continue to hold firm to a bullish outlook on the positive long-term fundamentals of the U.S. housing market and believe investors are underwriting to this thesis as well. This is confirmed by the demand we see in the building products M&A market as well as recent conversations with strategic and financial buyers. ■

and trained, as well as provided with contact information for legal counsel in the event outside assistance is needed to address any inquiry.

Second, conduct an internal review of your employee work eligibility documents to prepare for an ICE inquiry and confirm compliance with all federal laws. Ensure each employee's work eligibility can be supported with the necessary documents. Promptly address any discrepancies or missing documentation. On an ongoing basis, periodic internal audits will ensure your documents remain current and complete, especially if the nature of your workforce is subject to frequent change or may prove seasonal. Your designated contact should also be familiar with the documents that will need to be presented in the event a work eligibility inquiry is made. The contact should also have the credentials to access those documents at all times.

On-site ICE visit

ICE may visit your physical company property and request, or even demand, to be permitted entry to conduct a work eligibility inquiry. This request can proceed only with either your consent or through ICE's provision of a valid warrant. In the interest of maintaining formality and following proper procedures, it is advisable to always first request a valid warrant be presented. This step will help ensure that decision-making regarding consent is removed from your employee-representative's scope of responsibility in reliance upon established company procedures. Providing clear guidance to review and confirm a valid warrant before access can assist your designated representative in a successful interaction with ICE.

It is important to train your designated representatives to determine whether a specific warrant is valid and sufficient to proceed. For example, the warrant must be signed by a judge, as opposed to an administrative arrest warrant. This is where legal counsel can assist if there is any question regarding the nature of a presented warrant.

Navigating the Storm

Prepare for ICE on-site visits and ensure compliance with IRCA

BY MELANIE SCHERER

The challenges of being an employer are always evolving. One of those evolving issues is compliance with the Immigration Reform and Control Act.

At its most basic, IRCA requires an employer to provide documented eligibility for all of its human resources. Employment Eligibility Verification Form I-9 is used to verify the identity and legal work eligibility of paid employees. The law outlines express requirements employers must meet to attest to their worker's eligibility for employment and steps that must be taken to avoid recruiting unauthorized workers. Most employers are generally familiar with this aspect of the federal law and need to effectively address work eligibility inquiries.

Many employers are not as familiar with other aspects of IRCA

enforcement; in particular, an on-site visit by representatives of United States Immigration and Customs Enforcement, or ICE. Taking a few steps to prepare for such events can help your company and your employees respond appropriately and in accordance with all legal requirements.

Plan for on-site inquiry

First, it is recommended to designate a company point of contact who will be responsible for any ICE inquiry into employee work eligibility. If you have multiple locations, consider designating an employee representative for each site, or alternatively, a point of contact to field inquiries from multiple locations depending on the structure of your business. Your designated representative should be educated

Employers can consent to access without a warrant. In those circumstances there can be later contests by affected individuals and the scope of what is subject to disclosure can become legally clouded. Regardless, access can be voluntarily and also be withdrawn at any point.

Document compliance

Once the issue of entry is addressed, documentation and compliance become the focus. Ideally, through preparation, review and training, your company's designated contact will already be familiar with the I-9 documents that need to be presented to confirm compliance with IRCA. Providing complete and accurate documents for each employee will result in successful completion of this administrative process. Here too, the scope of information subject to access can be spelled out in the warrant and

should be reviewed to ensure full compliance.

Escalated or external guidance

While your designated company representative should be trained to evaluate the sufficiency of a warrant presented for entry, this person should also feel comfortable to reach out to management, legal counsel or other escalation pathways within your company. If there are questions surrounding the validity of a warrant, or if no warrant is presented, it is acceptable to request that ICE remain outside of private, employee-only portions of the premises. At that point, internal communications can occur to determine how to best proceed while remaining compliant. If needed, the designated representative should escalate communication to a person within your company who can quickly assist to provide further instruction or reach out to those who can.

Employee rights

As a final consideration, just like employers, individuals also have rights. These can include the right to remain silent, even if questioned, and the right to request legal representation. Companies need to ensure that their policies balance complying with legitimate requests for access, while also not infringing on the rights held by individual employees.

Taking some prudent steps in advance, employers can prepare so that a potentially stressful situation becomes a simple administrative inquiry in keeping with established company protocol. ■

to monitor training compliance; supervisors can track employees' training activity and test scores using the MyGlassClass.com Team Manager functionality. Companies can customize their Team Manager to monitor and conduct training for different lines, under different line leaders. While all employees may be required to take safety courses, for example, only a few may need glass measurement and math training. The Team Manager function allows companies to customize training for different employee groups, as well as run comprehensive reports on individuals or all employees.

Closing the Skills Gap

Training for glass fabrication personnel now available via MyGlassFAB

BY JENNI CHASE

Editor's Note: This article originally appeared in Window + Door's sister publication, Glass Magazine. As more window and door fabricators move glass production in-house, the Window + Door audience also can find value in courses through MyGlassFAB.

The manufacturing industry is facing a skills gap. Industry growth is driving the need for more workers of every type—from entry-level production personnel to skilled workers to engineers, according to the 2024 Deloitte and Manufacturing Institute Talent Study. This is not news to the glass and fenestration industry, where the skills gap reveals itself as a lack of industry experience among new hires. Glass fabricators report this is true at all levels of employment, but particularly among entry-level production personnel, who often come onboard with little to no glass experience. To help close that gap, the National Glass Association has launched MyGlassFAB.

Addressing the skills gap

MyGlassFAB is designed for entry-

level production personnel who are responsible for tasks like inspecting and measuring glass; loading and unloading glass; and rotating glass through the various phases of the tempering, laminating, cutting or shipping processes. Available on the MyGlassClass.com online learning platform, MyGlassFAB allows new personnel to take training courses on their phones. The interactive courses range in length from five to 15 minutes, with the initial training focusing on safety, glass quality inspection, how to measure glass and basic math. Courses are available in English and Spanish, and as the course catalog grows, NGA will add training on tempering, laminating, decorative glass and insulating glass production.

Tristar Glass, which has three glass fabrication plants in the South-Central U.S. that span 390,000 square feet and employ more than 250 people, uses MyGlassFAB to onboard new employees. As part of their orientation process, new hires take MyGlassFAB courses on their phones, alongside an instructor.

MyGlassFAB also allows companies

The applicant gap

The manufacturing industry faces not just a skills gap, but an applicant gap. There is a shortage of potential candidates applying for positions, whether skilled or unskilled, according to the Deloitte/MI Talent Study.

The labor pool continues to challenge industry companies. Nearly half of respondents in Window + Door's 2025 Industry Pulse survey indicated recruiting is their top labor challenge. Employee retention isn't far behind. Several survey respondents noted quality training is an effective way to retain quality employees.

The Deloitte/MI study substantiates this. "Many companies are also leveraging e-learning platforms to facilitate flexible and self-paced learning opportunities," the research group reports.

To view the MyGlassFAB course catalog, visit myglassfab.com. To learn more about how to set up a company training program using the Team Manager functionality, email myglassclass@glass.org. ■

STORMFORCE

In coastal regions, protecting your home from extreme weather isn't just a consideration—it's a necessity. That's why Wincore® has engineered its impact-resistant windows and doors to meet the highest standards of safety and durability. Specifically designed for areas prone to hurricanes and severe storms, our StormForce™ series offers unmatched protection while maintaining the elegance and style homeowners desire. Built tough to withstand the harshest elements, these products deliver reliable performance and lasting peace of mind—without compromising on curb appeal. With Wincore, you don't have to choose between safety and style—you get both.

SET THE STANDARD. AND THEN SURPASS IT.

Because to us, *That's the way it should be.*™

Whether you're looking to boost curb appeal or fortify your home, Wincore delivers the perfect fit. With multitudes of door styles and window options to choose from, finding the right look and level of protection has never been easier. Crafted for durability, beauty, and peace of mind, Wincore products set and surpass the standard in both form and function.

WINCORE
WINDOWS & DOORS

Wincore Windows and Doors® offers a wide range of premium entry doors and windows, including high-performance storm-resistant options built to handle even the harshest weather.

The Importance and Future of Impact-Rated Products

Industry experts weigh in on the significance of hurricane impact-rated products

BY RACHEL VITELLO

Kolbe Windows & Doors' Vista Luxe Collection is an example of impact-rated products for the residential market.

© Phillip Ennis

When hurricanes storm through communities, they can ravage and destroy peoples' homes, businesses and other property. Hurricane impact-rated systems—the windows, doors and other glass and fenestration products that are specifically designed and tested to withstand the high winds and flying debris that come along with hurricanes—are one way to help alleviate and prevent this destruction. These systems are especially important in areas prone to hurricanes, like coastal regions in the United States.

“Hurricane Helene traveled nearly 500 miles inland, creating disaster areas in Florida, Georgia, North Carolina and Tennessee. The glass and fenestration industries continue to innovate and enhance the performance of all their units to combat extreme weather conditions,” says Mike Layne, regional sales manager, Kolbe Windows & Doors. “Now is also the time for manufacturers to educate all customers on the impact options available, clearly demonstrating the level of performance these windows and doors offer while communicating

their ability to adapt to a variety of lifestyles and visions.”

The importance of impact-rated products

Hurricanes and other extreme weather events can have a devastating effect on homes, even if only one system is damaged. “Impact-resistant products are essential for protecting a home from rapid internal pressurization,” says Dean Ruark, vice president of engineering and innovation, Miter Brands. “If a single window or door fails during a storm,

Engineered for Flexibility. Now Expanded for Compatibility.

The Vision Constant Force Balance System is now available in a 3/4" size.

Due to overwhelming demand, Vision Hardware has expanded its popular constant force balance system to now include a 3/4" version. This new size accommodates windows designed with larger cavities—delivering the same easy integration, consistent performance, and fast fulfillment you've come to expect from Vision. (Patent Pending)

Add the 3/4" Constant Force Balance to Your Next Supply Order.

- A full range of single, double, triple, and quad balances up to 44 pounds.
- Preassembled to meet your exact specifications for easy integration.
- Integrated pivot bar containment option available
- Easy reconfiguration if needed, providing adaptability to changing requirements.
- Multiple housing options and brake forces are available to suit your needs.
- Various pivot bars and mounting clips are available to accommodate your unique design.
- Open cam design allows for a lift-out sash with a single non-handed SKU.
- Tensioning screw enables customizable friction on cusp weights.
- Independently tested and listed on the AAMA-approved product list for quality assurance.
- Now available in both 1/2" and 3/4" widths to support more window designs.
- Next-day pickup or 24-hour shipping available on all stocked parts.

it can create intense pressure on the building's roof and walls, often leading to catastrophic structural failure."

According to Layne, the primary advantage of impact-rated products is the enhanced performance they offer to a home's interior against windborne debris during hurricanes and tropical storms. Additional benefits include superior UV ratings, improved energy efficiency and better acoustic performance.

"It's important to invest in impact-rated products if you live coastal areas because they help protect homeowners and their families from the devastating effects of hurricanes and extreme weather," says Jeffrey Gore, vice president general manager coastline, Marvin. "They also eliminate the inconvenience, cost and aesthetics associated with using plywood sheets and storm shutters which require installation, removal and storage."

Marvin produces impact-rated windows and doors in its Coastline, Ultimate and Elevate product lines that are engineered to withstand high winds and flying debris generated by severe storms. These impact certified products appear the same as standard products, with no visible differences such as hinges or added reinforcements. Properly installed windows and doors

harden a home and prevent storm damage by maintaining structural integrity, ensuring that extreme winds do not penetrate and create dangerous pressure imbalances that can lead to catastrophic structural failure.

The future of impact-rated products and the industry at large

Josh Jensen, president of YKK AP's residential business group, says that these more frequent weather events often cause building codes to be reviewed and modified, which drives changes to product development and design. Jensen says that when it comes to impact-rated systems, customers have been asking for larger window lites, a bolder aesthetic and energy efficiency. "These trends will likely remain; however, we will likely see higher demand for hurricane-resistant windows and doors in coastal areas, and in particular, Florida," says Jensen.

Layne says the most common request for impact-rated systems is for larger units; however, the laminated glass used in the construction of impact-rated units has size limitations. Architects and home designers who frequently work in regions where building codes mandate impact products have grown increasingly aware of these constraints and how to design their projects accordingly. Layne

adds that geometric windows with impact capabilities are also in demand, and they serve as an excellent design solution. Unique shapes like triangles or trapezoids are another way for designers to maximize the use of glass and frame views of the outdoors while working within the size limitations.

In Florida specifically, Ruark says that many new Floridians are less familiar with hurricanes, which has driven a surge in demand for impact-resistant products. "Currently, most of the conversation centers on designing for surge, scouring and wave action, as recent hurricanes have been predominantly surge-related. However, when we see wind-driven storms like Hurricane Andrew, or more recently Hurricane Dorian, which bring significant debris impacts to structures, the focus traditionally shifts to improving impact-resistant products and standards. Both surge and wind resilience will likely shape future industry standards and building codes."

Ruark adds that the Florida Building Code is proving effective, where homes built to recent codes are withstanding the barrage of hurricanes that have made landfall in Florida in 2024. He says that Miter is exploring "code-plus" options, such as those in the IBHS Fortified Program, which prepare buildings for even more severe wind events than current codes mandate.

"In light of recent hurricanes, it is likely that more regulations will be introduced in areas that have traditionally recommended—but not required—the use of impact-rated products," says Layne. "Relatedly, new customers are expected to express an interest in impact-rated window and door products for the first time."

Gore says that moving forward, the glass and fenestration industries should proactively enhance product offerings to anticipate the intensifying demands of extreme weather; including investing in R&D for stronger, more resilient materials, and manufacturers should emphasize education for contractors and homeowners about the importance of proper installation and maintenance of impact-rated products. ■

WINDOW AND DOOR MANUFACTURERS REPORT BROAD-BASED GROWTH IN SALES, PRODUCTION AND INNOVATION—WHILE NAVIGATING TARIFFS, LABOR SHORTAGES AND ECONOMIC UNCERTAINTY **BY LAURIE COWIN**

A close-up photograph of a man with a beard and safety glasses, looking intently at his work. He is wearing a dark blue t-shirt. The background is a blurred industrial setting with bright lights.

T

This year's Top Manufacturers Report reflects, in a word, growth. Growth in sales. Growth in production. Growth in business and product development.

Even so, plenty of unknowns and challenges test the industry. As of this writing, U.S. President Donald Trump's administration has implemented tariffs on dozens of countries, including a 104% levy on Chinese goods. China has responded with a retaliatory tariff of 84% on U.S. goods.

Concerning though these tariffs are to many in the fenestration industry, several respondents noted everyone is in the same boat and all are navigating it together.

This year's Top Manufacturers Report gives an overview of the new construction and remodeling and repair markets, plus the state of the larger manufacturing industry, before diving into findings from the Top Manufacturers survey, which collected responses in March 2025. The report is bolstered by data from John Burns Research and Consulting's quarterly Window & Door Market Survey, the result of an exclusive partnership between Window + Door and JBREC.

The

Big

Picture

New construction

Last year ended with single-family growth in all geographic regions, according to the National Association of Home Builders Home Building Geography Index. “Single-family housing construction ended the year with growth as a shortage of existing homes for sale continues to increase demand for newly built homes,” says NAHB Chairman Buddy Hughes.

“Single-family construction has been holding remarkably steady, despite elevated mortgage rates and tight lending standards for construction and development loans,” says NAHB Chief

Economist Robert Dietz. “Upside and downside risks will become clearer as the new year progresses. An easing regulatory environment and tax cuts could act as tailwinds, but tariffs and potentially higher deficits could dampen market momentum. Additionally, a growing trend away from work-from-home could increase building activity in inner suburbs in the quarters ahead.”

New home sales increased 1.8% in February and are up 5.1% compared to a year earlier, according to data from the U.S. Department of Housing and Urban Development and the U.S. Census Bureau. The organizations also

report that overall housing starts increased 11.2% in February to a seasonally adjusted rate of 1.5 million units.

“Lower mortgage rates helped to lift demand in February, despite other near-term risks such as tariff issues and affordability concerns,” says Dietz. “While new home inventory is at an otherwise elevated 8.9 months’ supply, total home supply—new and existing—is a relatively lean 4.2 months’ supply for February.”

Builders continue to express concern. “While solid demand and a lack of existing inventory provided a boost to single-family production in February, our latest builder survey shows that builders remain concerned about challenging housing affordability conditions, most notably elevated financing and construction costs as well as tariffs on key building materials,” says Hughes.

R&R

Annual expenditures for improvements and maintenance to owner-occupied homes are expected to grow modestly through 2026, according to the latest Leading Indicator of Remodeling Activity from Harvard University’s Joint Center for Housing Studies. Year-over-year spending for home renovation and repair will increase a projected 2.5% to reach a record \$526 billion by the first quarter of 2026.

The report indicates high home values and other strong economic indicators have supported an uptick in homeowner improvement spending, but cautions economic volatility around tariffs and falling consumer confidence could dampen this expected growth.

Meanwhile, the NAHB/Westlake Royal Remodeling Market Index for the first quarter of 2025 showed a five-point drop in remodeling market sentiment. Although the reading of 63 is in positive territory, it is only the second time since the first quarter of 2020 that the RMI has been this low. Dietz echoes the LIRA’s caution. “The five-point decline in the RMI likely reflects consumer uncertainty, fueled by rising costs and tariff concerns,” he says. “Although almost all the data for the first-quarter RMI were collected before the release of specific reciprocal tariffs, the debate and uncertainty over tariffs has had an effect on consumer confidence. Indeed, remodelers responding to the RMI survey reported that their suppliers have already increased prices by an average of 6.9% since January, due to the anticipated effect of tariffs.”

If Congress fails to act now on extending the Tax Cuts and Jobs Act, 69.35% of survey respondents will delay purchasing capital equipment. Additionally, 45.23% would hold off on hiring, 44.72% would stall expansion of operations, 41.71% would limit R&D investments, and 40.20% would curb increases in employee wages or benefits.

Manufacturing

The U.S. faces a shortage of 1.9 million manufacturing workers by 2033, according to a study from the Manufacturing Institute and Deloitte. Nearly half of the 3.8 million positions that will open could go unfilled. The manufacturing industry averages about 500,000 open jobs through the past 12 months, making it a systemic challenge rather than a short-term trend, said Carolyn Lee, president and executive director, Manufacturing Institute, in the State of the Manufacturing Workforce Address in February. Retirement and manufacturing growth contribute to these shortages.

“We have to inspire more Americans to see themselves in manufacturing,” Lee says. “That starts early, with programs that spark curiosity and excitement for careers in our industry. And when I say early, I mean as young as

nine or 10 years old—because today’s fourth graders will graduate in 2033 and may be our future team members.”

The National Association of Manufacturers Q1 2025 Manufacturers’ Outlook Survey revealed 76.2% of participants cite trade uncertainties as the foremost challenge. This is a 20-percentage point increase from the prior quarter and 40 percentage points from the third quarter of last year. Increased raw material costs were the second-most cited challenge (62.3%).

The survey also says that if Congress fails to act now on extending the Tax Cuts and Jobs Act, 69.35% of survey respondents will delay purchasing capital equipment. Additionally, 45.23% would hold off on hiring, 44.72% would stall expansion of operations, 41.71% would limit R&D investments, and 40.20% would curb increases in employee wages or benefits.

Meet the Respondents

Respondents to this year's Top Manufacturers survey had about equal parts national versus regional companies, with a small percentage serving Canada only. The highest number of respondents posted sales in the \$100-\$200 million range, but participants ranged from upwards of \$1 billion in sales to less than \$15 million, ensuring the survey data represents small, medium and large manufacturers.

Sales, Growth and Production

Most survey respondents indicated growth in nearly every area the survey queried about. The Window & Door Market Survey, in partnership with John Burns Research and Consulting, substantiates this. Over half (55%) of window and door companies reported volumes growing in fourth-quarter 2024 with average volumes across all companies growing 2.2% year over year. Revenue likewise increased, with an average year-over-year growth of 3.7%.

Many companies have expanded into new geographic areas and have plans to continue that growth. Several also referenced facility additions and expansions to increase production and add product lines. Marvin, for example, is investing in a 400,000-square-foot manufacturing facility in Kansas City, slated for completion this year. It also opened two new distribution centers in the past year.

“We are in the process of expanding our manufacturing facility in 2025 to add innovative aluminum storage solutions and improved aluminum fabrication equipment,” says Sarah Harper, president, All Weather Architectural Aluminum. “These investments are a predecessor to launching a whole new line of minimalist, modern windows and doors.”

More companies each year indicate they are bringing more glass operations

in house. Yet others have explored new markets, such as multifamily, commercial or focusing on new construction or replacement markets.

“ProVia has dramatically grown in every area over the past five years. We have more than doubled our employee count, built new facilities, bought and renovated other facilities, acquired a lamination company, and increased market share,” says Joe Klink, executive director of corporate engagement, ProVia.

Despite the labor concerns in the industry, many survey respondents cite hiring more people to keep up with the growth and product demand.

“We have grown from 400 to 700 employees and expanded into glass tempering through GlassBuilt Manufacturing,” shares Durabuilt Windows & Doors. “Our revenues have doubled, with consistent year-over-year growth of 18% to 24%. We have increased market share across all regions and successfully expanded into British Columbia. Innovation continues to drive our success with the introduction of new product lines. Beyond products, we have made significant advancements in supply chain efficiency, automation, IT infrastructure and operational systems, reinforcing our ability to scale.”

Sales

gic expansion and innovation, as well as a shareholder transition that enabled the company to invest \$8 million in automation and restructuring into business units. “Our focus on innovation—26% of current sales come from products developed in the past four years—has helped us gain market share and sustain long-term growth,” shares the company.

Production growth is also high on companies’ minds. Responses for what drives production growth vary from “everything,” or, “nearly every business factor,” to specific product materials and processes, such as aluminum, co-extrusion and insulating glass units, to specific business goals like product quality and safer processes.

“We are focused on enhancing several key areas of production, including the addition of a new glass line and upgrading our welding capabilities with new welders and weld cleaners,” says Aron Perelman, vice president marketing and sales, Climate Solutions Windows and Doors.

Enhancing production, including automation, also allows companies to shift current employees to areas that require more skill.

Products

Energy efficiency rules much of today’s product development, with over a third of respondents planning to put product development dollars into energy efficiency in 2025 and efficiency being the most-requested product feature from customers. (Larger windows and doors and color are close behind.)

Although most companies do not have Environmental Product Declarations for their products, the 18% that reported they do is up from the 11% of companies that reported having one in Window + Door’s 2025 Industry Pulse survey.

Among those that do not have EPDs, most report they are not important to the end user and creating EPDs is not a priority. “As a small company, we continuously evaluate where to make investments that will have the greatest impact on our customers, colleagues and communities. Unfortunately, the EPD has not made it to the top of priorities in recent years,” wrote one respondent.

Some, however, do note requests for EPDs, with some saying the requests are “frequent” and others saying requests are increasing. Others note it is part of their commitment to environmental responsibility and helps support transparency.

Beyond requests is a sense of responsibility for some companies. “It

aligns with our vision to create healthier and safer living environments,” writes manufacturer ES. “At ES, having an EPD reflects our commitment to sustainability and transparency. It allows us to support green building certifications, meet regulatory requirements, and provide our clients with verified data on the environmental impact of our windows and doors—helping us drive responsible innovation and reduce our carbon footprint.”

In addition to sustainability and energy-efficiency considerations, technology continues to infiltrate the product sector in two major categories: hardware and glass.

Automatic sliding doors primarily target the luxury market right now. More and more entry door manufacturers offer entry door locks controlled via smartphones, digital keypads or finger scanners. “We offer automated products because they enhance functionality, comfort and energy efficiency meeting the evolving needs of modern architecture and smart living,” representatives from ES share.

Privacy glass, such as CLiC and Fog are gaining momentum for added customization, security and energy efficiency. “We continue to explore smart

Labor

Despite labor being an evergreen pain point, manufacturers indicate it's no harder to find workers than usual. And most plan to hire new employees this year. Challenging though recruitment can be, it is employee retention that tops manufacturers' labor struggles. A positive company culture and competitive salaries are by far the most effective retention strategies.

On the recruitment side, nearly one-third of companies note referrals are the most effective strategy. Agencies and open interviews come in a distant second and third.

Training is another big component of labor and serves to both attract new talent and retain existing talent. Companies share a range of difficulties around training new employees. Some of it involves employee motivation and reticence to learn new skills. Other challenges revolve around language barriers. Many comments reference the time commitment for training—the time it takes to train a new employee, the struggle to find time among an already stretched-thin workforce and the years it can take to build a true knowledge base for what can be very customized and complex products. “The majority of our manufacturing process are craftsman positions, with hand tools. Learning the materials behaviors and natural tendencies and learning the ‘feeling’ is a talent that goes beyond a standard operating procedure,” shares Tanisha

Arellano, chief operating officer, Pan-
oramic Doors.

“Training new employees can be time-consuming, especially if it involves teaching complex processes or systems,” shares Patrys Wild, senior vice president and chief human resources officer, YKK AP North America. “Balancing training with regular work responsibilities can be challenging for both the trainer and the trainee. This applies to both sides of training; managers must dedicate time while still completing their work. The new employee must learn everything with the expectation that they can begin producing in short order, sometimes even before they are completely trained.”

Wild further notes that it can be difficult for new employees to retain large amounts of information, especially as it could be likely new employees lack essential knowledge and experience in fenestration. “Because we participate in a niche industry, we sometimes underestimate the ability for new employees to grasp key concepts quickly,” she says. “Reinforcement and repetition may be necessary to ensure comprehension and retention.”

Cross-training is another critical part of training, which also demands time and a willingness to teach and learn. “This requires new hires to learn and master a wide range of tasks and procedures quickly, while we balance our daily production requirements,” says Perelman.

“The majority of our manufacturing process are craftsman positions, with hand tools. Learning the materials behaviors and natural tendencies and learning the ‘feeling’ is a talent that goes beyond a standard operating procedure.”

Automation & Technology

Three years ago, 84% of manufacturers used automation. Today, that number has grown further to 91%. Nearly two-thirds anticipate adding automation in the coming year. Welders, cleaners, robotics, tooling, material handling, assembly, packaging and glass fabrication are all on the table for where companies leverage automation.

“It can vary from a simple machine that makes a repetitive process easier to a more complex machine cell that automates multiple processes,” writes Miter Brands. “In short, we’re looking to make the hardest work easier.”

This year’s survey asked manufacturers how they decide to add automation. Return on investment, enhanced employee safety and cost-benefit analyses factor into the decision, but it goes much deeper than that.

Automation and technology should facilitate continuous improvement. ES shares its process: “We evaluate the potential return on investment, considering factors like increased throughput, labor optimization and reduced waste. We also assess how automation will integrate with our existing systems and workforce,

“We evaluate the potential return on investment, considering factors like increased throughput, labor optimization and reduced waste.”

ensuring it supports—not disrupts—overall operations.”

Artificial intelligence is another area of growth. While only 36% of respondents use it in their businesses, the figure is growing. Most manufacturers report using it in an office setting. AI helps generate marketing materials and automates meeting minutes and other administrative tasks. It can also help employees craft emails, communications, and respond to service issues and online reviews.

Looking Ahead

Housing affordability is affecting the industry. While 40% indicate it hasn't influenced their business, a full quarter are unsure, with the remaining indicating it has. The list of how is extensive. Builders are downsizing their homes to increase affordability. Markets aren't growing with the economy. High interest rates affect both new construction and R&R. An overall increase in home costs leaves less for people to spend on home improvement costs, plus many consumers are conservative with their incomes during times of uncertainty.

Of note, however, is that the luxury market remains mostly insulated from the effects of housing affordability.

The Window & Door Market Survey showed material costs increased an average of 6% year over year for companies. However, more than two-thirds of respondents report no extended material lead times, allowing for improved cycle times.

Many respondents wrote about concern over what some call the "tariff wars." They've extended the lead times on raw materials and, of course, cost. Some companies seek to renegotiate vendor partnerships and explore other supply chain options.

"The economic climate is decreasing consumers' confidence, which in turn will translate into potential lower sales."

"The economic climate is decreasing consumers' confidence, which in turn will translate into potential lower sales," writes one manufacturer. "This will compound with rising labor and material costs, challenging the overall business profitability."

Top Manufacturers survey respondents shared several tactics for tackling tariffs:

- Sourcing domestically as much as possible
- Raising prices as needed

- Ensuring secondary and tertiary suppliers
- Maintaining transparency with customers
- Absorbing costs where possible
- Meeting with elected representatives
- Splitting the costs with suppliers

Data from John Burns backs this up. About 73% of companies expect to raise prices in 2025 with an average increase of 3.6%. The same survey revealed an overall optimism for business in 2025: 91% expect full-year 2025 revenue to be the same or higher than in 2024. Of note, however, is the likelihood that revenue increases will be related to price rather than increased volume.

It can be easy to focus on the challenges, but the other side of the same coin is the opportunities the industry looks to leverage. Those opportunities can include growing market share in adjacent geographies, adding products and expanding marketing efforts. One company notes it is recognizing cost efficiencies through doing its own glass. Others are growing into the multifamily market. ■

01. Roto North America

Roto's Patio Alversa offers a range of sliding solutions, including one tilt and slide and three parallel sliding options. These solutions provide various ventilation functions and are compatible with all frame materials, accommodating sash weights from 352 pounds to 440 pounds. The product ranges' same roller units, sliding scissor stays and track sets are compatible across multiple versions, and all versions can be produced on the same production line. All versions offer different ventilation options and burglary inhibition components.

860/526-4996 | ROTONORTHAMERICA.COM

02. NanaWall Systems

NanaWall's Generation 4 tilt and turn windows are designed to complement the existing Generation 4 product family with the same uniform glass lines and frames. The Generation 4 tilt and turn windows are engineered with dual-opening functionality, tilting vertically and turning horizontally. Other features include continuous perimeter seals, concealed hardware, and double- or triple-insulating glass.

800/873-5673 | NANAWALL.COM

03. Velux

The Velux skylight system is designed for total light control, enhanced energy efficiency and homeowner convenience. The skylight system features a pre-installed, remote-controlled, solar-powered shade, as well as a white shade. Alternative shade colors are available by custom order. The solar-powered remote operation charges on ambient light and includes optional smart home integration. Built-in rain sensors on venting skylights enable automatic closure.

Product/Solution

The FuseCube Express delivers consistent, automated Diamon-Fusion coating to both sides of the glass in a single cycle.

Key features

- Automated dual-sided coating in one cycle
- Plug-and-play installation with a compact footprint
- Enhances glass with hydrophobic, easy-to-clean properties
- Reduces maintenance costs and extends glass lifespan

FuseCube Express // Diamon-Fusion International

Challenge

The FuseCube Express™ by Diamon-Fusion International is a cutting-edge protective glass coating machine that automates the application of DFI's patented Diamon-Fusion® coating on both sides of glass panels in a single cycle. This innovation was developed to meet the window and door industry's demand for efficiency, consistency and enhanced product value.

Solution

With a compact, plug-and-play design, the FuseCube Express is perfect for glass fabricators of all sizes. It eliminates the need for manual coating methods, which can be time-consuming and inconsistent, replacing them with a fully automated process that ensures quality and uniformity. The machine bonds Diamon-Fusion directly to the glass, creating a hydrophobic, scratch-resistant surface that is easier to clean and maintain over time.

Options

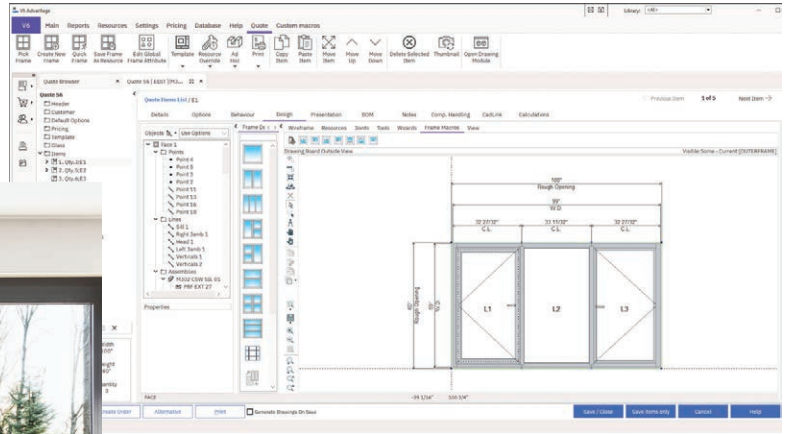

In addition to performance, the FuseCube Express helps reduce water usage, cleaning chemicals and labor, making it a more sustainable and cost-effective solution for today's manufacturers.

Results

"With FuseCube Express, we're empowering fabricators to differentiate their products in an increasingly competitive market," says Guillermo Seta, vice president of business development, DFI. "It's not just about surface protection, it's about delivering lasting performance and customer satisfaction."

For more information, visit dfsolutions.com or call 949/388-8000. ■

01. Alpen High Performance Products

Alpen now offers slimmer profile options in its Tyrol uPVC window system. Tyrol Edge and Tyrol Contour advance the platform's design flexibility while preserving its energy efficiency, with whole-window thermal performance up to R-11 (U-0.09). Tyrol is manufactured from uPVC, with a multi-chambered frame design and continuous fiberglass reinforcements.

303/834-3600 | THINKALPEN.COM

02. Nova Doors

Nova Doors' high-performance fiberglass-aluminum hybrid door sill balances structural strength, energy efficiency and advanced water management, all in a 1 ½-inch profile. The sill features a fully supported anodized aluminum cap bonded to an injection-molded ABS base. A fixed fiberglass sill riser creates a thermal break, reducing conductive heat loss at the threshold. To prevent water intrusion, the sill includes a dual-layer protection system.

03. Cyncly

Soft Tech V6 Advantage is a customer-driven release that builds on the capabilities of Soft Tech V6, adding capabilities that help manufacturers improve their estimation, strengthen their dealer network and streamline manufacturing processes. The software can produce out-of-the-box reports and custom reports to track performance and gain business insights. A customer portal provides access to an online ticketing system, release notes, troubleshooting tips and more. Online training videos also are available.

Rethinking Plastics: An evolving industry's push for top talent

By Lytia Watson

Once perceived as static, industrial and bad for the environment, the plastics industry has transformed significantly over the past few decades. A career in plastics manufacturing offers long-term growth and career fulfillment and provides a pathway for someone to have a positive environmental impact. This presents an opportunity for manufacturers to reestablish their image with the public on sustainability and the robust career opportunities that exist in manufacturing. This, in turn, will help such employers to appeal to smart, ambitious job seekers in a competitive recruiting landscape.

By fostering a culture of innovation, sustainability and continuous improvement, Deceuninck North America is positioning itself as one of those employers of choice. It prioritizes key initiatives such as complex and innovative training programs; an emphasis on diversity, culture building and inclusion; and an unwavering dedication to sustainability that aligns with the values of the modern workforce.

To truly thrive, the entire plastics industry must address misconceptions and actively work to attract new talent by demonstrating how it has become much more innovative and environmentally responsible.

The Denver apartment complex before (left) and after (right) being retrofitted with Simonton DaylightMax windows.

Apartment Complex Revitalization

Project: Denver, Colorado, apartment complex

Products: Simonton Windows & Doors DaylightMax windows

Description: In Denver, Colorado, an aging three-story apartment complex needed a transformation, and quickly because tenants were slated to move in. As part of a broader neighborhood revitalization, property managers turned to Lakewood Glass and

Windows to bring the building up to modern standards—starting with new windows.

With energy efficiency and tenant comfort as priorities, Matt Vergano, owner of Lakewood Glass and Windows, chose Simonton Windows & Doors for the job. Over just five days, the team replaced the outdated windows with 109 of Simonton's DaylightMax sliding windows in a tan color.

The windows were chosen for their low

U-factor and high R-value, which help insulate the units, making them both quieter and warmer.

Simonton premium vinyl windows also offer weatherability, energy efficiency and thermal performance.

The retrofit took only five days and serves as an example of how thoughtful upgrades can benefit both property managers and residents. ■

BUILT ON INNOVATION

The largest event for the glass, window and door industries in North America is your place to see the latest innovations across the entire supply chain, from components to state-of-the-art processing equipment. With access to live demonstrations and education focused on the next residential trends, you'll leave with a clear understanding of where the fenestration industry is headed — and an unbeatable edge. **Everything you need to build a stronger business, all in one place.**

Registration opens July 24.
